

Help! I'm hitting Jira automation limits!

When was the last time you audited your existing automations?

Too long ago

It's time for an audit

Recently

I can't part with any of my automation rules

Let's review your existing automation rules

Identify if it needs to be an automation

Consider whether you need an automation or there's a different way to achieve your goal

Remove obsolete automations

Find and remove redundant rules (e.g., turn off rules for temporary projects)

Prioritize essential automations

Remove nice-to-have automations and focus on those that are business-critical (e.g., avoid automations for minor updates)

Merge and consolidate automations

Combine multiple rules that are doing similar things into one automation. Try if/else conditions!

Refine automation triggers

Adjust the triggers for your rules and add conditions so automations only run when needed

Adjust the automation frequency

Adjust their schedule so they only run when necessary (e.g., 1-2 times a day during off-peak hours)

Decide between global vs. project-specific automations

If an automation doesn't need to be global, limit it to specific projects to save processing and automation runs

Still have too many automation rules?

Yes

Get unlimited automations with an Appfire app!

Just tell us how you want to automate

No

Congrats!

Well done optimizing! Now, keep monitoring to stay within the limits.

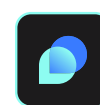

I'd like the intuitive, no-code option

JSU Automation Suite for Jira Workflows

Start free trial

I prefer a mix of no-code and low code

Jira Misc Workflow Extensions (JMWE)

Start free trial

I need full flexibility through scripting

Power Scripts - Jira Workflow Automation
